What should be considered when working with the Git system

How should I name a branch?

To name a branch, we use the task key. For example, let's say we have the following task:  TH-1 Решен Initialize Backend Repository with NestJS Андрей Коновалов

To start working on this task, you need to do the following::

1. Open the task and copy its key

2. Then choose the branch in the project that you want to branch off from.
3. Create a new branch: `git checkout -b TH-1`

How to commit and push changes?

For this, we use the following commit convention:  Соглашение о коммитах @Соглашение о коммитах . However, we do **not** use scopes. Instead of scopes, we use the task key.

Where,

- **feat** - used when adding new functionality.
- **fix** - bug fix.

- **hotfix** - urgent bug fix.
- **refactor** - code changes that neither fix bugs nor add functionality.
- **chore** - changes to configs, build system, dependency updates, etc.
- **test** - everything related to testing.
- **style** - typo fixes, code formatting changes (line breaks, indentation, semicolons, etc.) without changing the meaning of the code.
- **docs** - documentation-only changes.

For example, within the same task  **TH-1** Решен **Initialize Backend Repository with NestJS** Андрей Коновалов , a commit would look like this:

```
feat(HT-1): Added an endpoint for retrieving a user by id
```

A commit must be meaningful, informative, and atomic, so that a reviewer can look at each commit and understand what was done.

Branches with only one commit are not desirable.

! It is important to keep in mind that all commits must be written in **English**, and all changes that you add through commits while working on a specific task must contain that task key.

⚠️ If an urgent **hotfix** is needed, such a commit may be created without a task key.

I finished my task and made all the commits. How should I create a merge request correctly?

For this, create a new Merge Request in GitHub and specify the title in the following format:

```
KEY: Task description
```

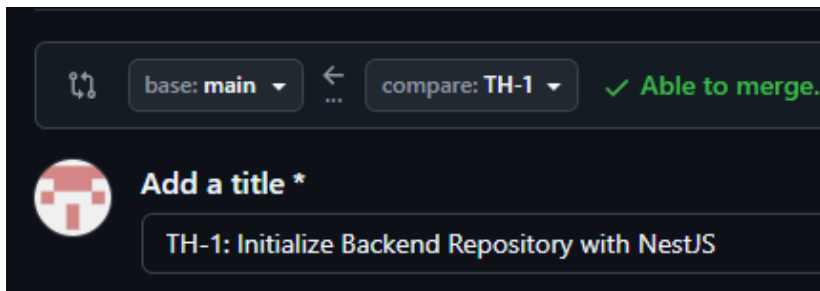

The description must match the task title exactly as it is written in the task itself.

The Merge Request must:

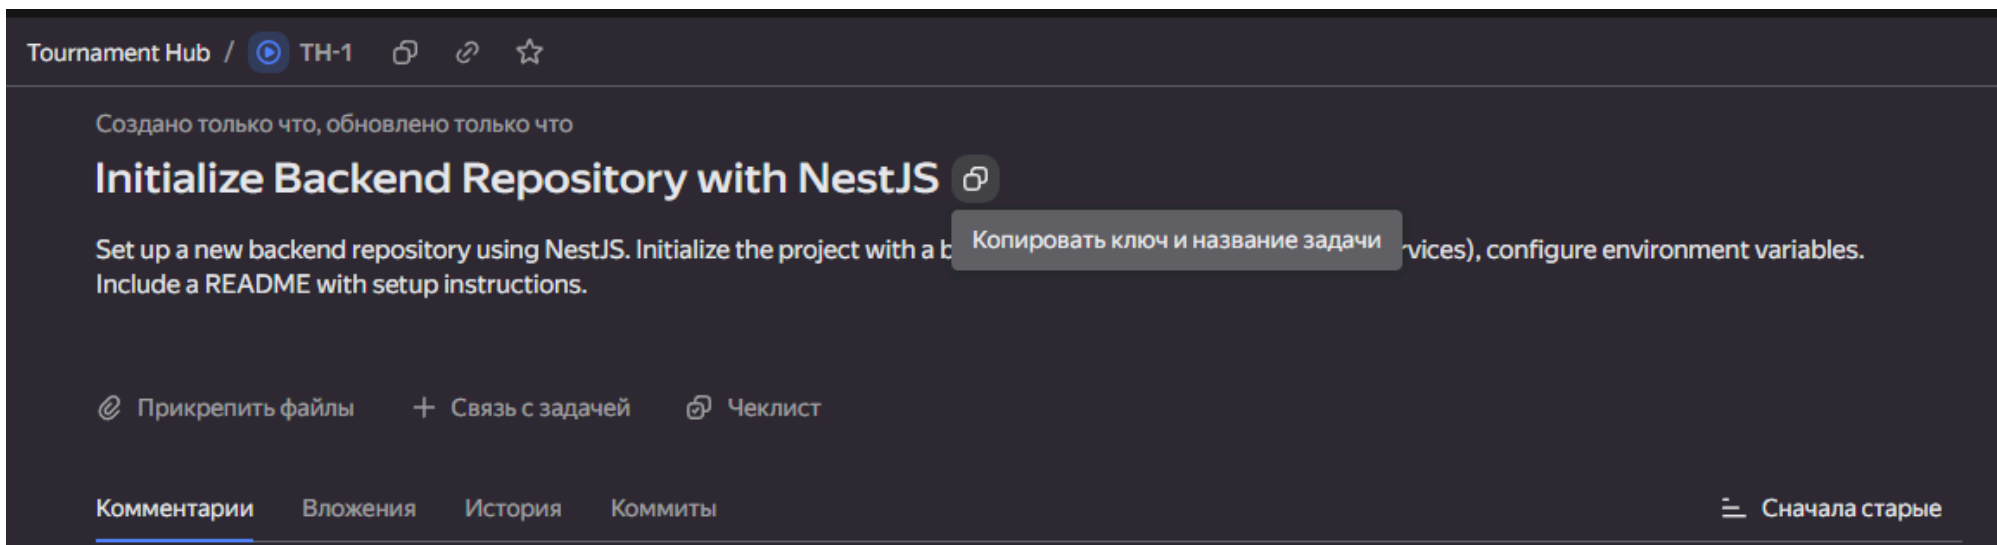

- target the correct branch;
- contain no conflicts;
- successfully pass all pipelines in projects where linters, tests, and static analysis are configured.

If new **environment variables** were added, this must be reflected in the Merge Request description.

Returning again to the repository initialization task, it would look like this:

To avoid typing all this information manually every time, you can use the following button in **Yandex Tracker**:

Then, in GitHub, within the MR, add yourself as the **Assignee** and add the person who should review it as the **Reviewer**.

Task for which the **merge request** was created:

Статус	 В работе ▾
Ревьювер	 Андрей Коновалов
